

ABSTRACT

METALLIC FILM AND IMAGE-DISPLAYING MEMBER

5 A metallic film is provided, with ease and low cost, which can suppress the
dependency of the metallic appearance, the luminosity L^* and the hue on the observation
angle of an observer, using a commonly used metalescent inorganic pigment and a
commonly used colorant without modifying the surface of the metalescent inorganic
pigment. The metallic film comprises a laminate of a light-transmitting layer and a light-
10 scattering layer, each of which has a first main surface and a second main surface and
which are laminated so that the second main surface of the light-transmitting layer faces
the first main surface of the light-scattering layer. The light-transmitting layer comprises a
polymer and a metalescent inorganic pigment dispersed therein, and the light-scattering
layer comprises a polymer and a white colorant dispersed therein.
